

Abstract

A system and method for transmitting information from a sender at a source mobile unit to a recipient at a destination mobile unit. A sender at a source mobile unit (102) may select a destination mobile unit (106). An overture element may then be formed. The overture element may contain information from the sender at the source mobile unit (102) indicating that the sender desires to establish a wireless connection with the recipient at the destination mobile unit (106). At least one data burst message may be formed and the overture element may be incorporated into the data burst message.
